|PALOMAR |HEALTH

Medication Administration

Use your PAL to view medication orders

This process outlines how to administer medications using a <u>Tethered Scanner</u>.

1. Go to the Clarity Toolbar and select Medication Administration

2. Using the tethered scanner, scan the patient's wristband

The patient's Medication Profile will display after scanning

Verify Patient Name and FIN#

| | TEST, Female | TEST T, | | 2382177 10825767 | DOB: 08/02/74 Age: 41 years |

List of ordered medications that are available for the patient, at the time of scanning

3. Scan barcode on Medication

- a. The medication scanned should match the medication ordered and displayed on the list
- **b.** Verify the medication details prior to administering
- 4. If medication details are required, double click on the medication to provide further documentation

This page displays the medications that have been scanned and verified. Changes can still be made prior to signing by selecting a medication to modify.

In some cases the medications scanned do not match the dosages of the medications ordered. This may occur when Pharmacy only has a specific dosage of a particular medication, to supply. In this case, the administered dose would be modified and documented.

NOTE: Always follow the protocol for your unit. Ensure that the medications being given are for the unit that the patient is physically on (and meets their current level of care).

For example:

Medication scanned: Morphine 4mg, Inj, IV Push

Medication ordered: Morphine 2mg, Inj, IV Push

1. Identify and select the correct Morphine order

Medications are due but not administered

NOTE: Medications may not be given for a number of reasons. If this is the case, select **Not Given** and document the reason.

- 1. Select the medication from Profile list
- 2. Select Not Given and Reason
